Leptogium crispulum Krph. spec. nov.

Thallus pallide cinereo-glaucescens, membranaceus, adpressus, rigidulus, laevis, opacus, parum lacinato-incisus, laciniis approximatis et marginibus crenatis plicato-crispia, erectiusculis; apotheciae elevata, medio-cria (vel majuscula), margine pallide flavicante, disco concaviusculo vel plano rufo-rubente; sporae 4—6 nae ellipsoideae, utroque apice breviter acuminatae, hyalinae, 3—septatae, duobus loculis mediis transversis longitudinaliter semel divisis, long. 0,019—021, crass. 0,008—010 mm.

Ad folia arborescens eujusdam sempervirentis (coll. 117) et ad ramulos (coll. 118).

Similis Leptogio foliari Krph., sed thalli forma nonnihil recedens modusque crescendi alius. Laciniae thalli expansi parum evidentes non raro versus centrum et in ramulis totus thallus faciem assumunt omnino plicato-crispam pulvinatam.

(VII) *Изъясненіе таинства святых даровъ* (см. № 11). *Слово* въ съ-
дѣніи иѣзуитовъ, въ коемъ Иисусъ Христъ оглаголъ: *Иже съ-
мѣнишъ мя, таинство святых даровъ иѣзуитовъ*. *Исповѣдь* въ
коемъ Иисусъ Христъ оглаголъ: *Иже съмѣнишъ мя, таинство*
святых даровъ иѣзуитовъ.

**Leptogium foliare Krph. spec.
nov.**

Thallus glaucescens tenuiter membranaceus submonophyllus, suberbicolariter dilatatus, depresso-superficie tota rugulosa et subradiatim plicatula (passim plicis in lobulis crispis solutis), ambitu lobulato-incisus et crispato-undulatus: apothecia dispersa maijuscula, disco plane rufo-rubente, a margine tenui-integro pallide flavicante cincto et infra interdum adhuc margine thallino plicato-rugoso turgido submarginato; sporae 8 nae, hyalinae, ellipsoideae, muriformes in ascis elongatis angustis, long. 0,012—0,026, crass. 0,012—0,014 mm.

Ad folia arboris cuiuslibet sempervirentis, nobis ignotae (coll. 117. a et 230).

Thallus diam. circ. 1 Decimet., infra substrato (folio) arte adpressus. Sporae plerumque minime leculosae, 6 series loculorum transversales, saepè non nihil inordinate dispositas et inter eas etiam saepius 2—3 septa obsoleta praebentes.

Macau 1000 Kip

三

Lecanora (Lecania Mass.) micrommata Krph. spec. nov.

Thallus maculiformis tenuis, pallide-glaucescens, irregulariter dilatatus, partim continuus, partim vario modo interruptus et disjectus, hypothallo tenui nigricante; apothecia pusilla (diam. circ. 0,3—0,5 mm.), dispersa, numerosa, primum clausa, dein patelliformia, disco plano fusco vel nigricante, margine thallode tenui integro (arius evanido) cincto; sporae 8 nae, hyalinae, oblongae vel elongato-ellipsoideae, 3—15 ius 2—) $\frac{1}{2}$ — ptatae, long. 0,035—0,38 crass. 0,008—0,08 mm.; paraphyses graciles, discretae, hypothecium albidum.

Supra folia (coriacea) arborum plurium sempervirentium (coll. 225).

Species distincta, cum nulla alia foliicola commutanda.

Lecanora epiphylla Fée Ess. p.
99 tab. 1, f. 28.

Ad folia coriacea arboris cuiuspiam semperfurentis. Apothecia minutissima, tantum lenti ope conspicuae; thallus tenuissimus, maculam laevem cinereum, irregularēm, sed ambitu linea tenui obscura limitatam efformans; sporae non observatae sunt.

Ad folia coriacea arboris cuiusdam semperfurentis, in consortio Trichariae orbicularis Krphbr, raro. (coll. 269. a).

• 85 3 1 da 80

LA lot's sortidos s'aprenen durant la seva estada a Amançana, fent més fàcil la seva organització. Els mecanismes d'organització són els mateixos que en el seu temps havia utilitzat per a la seva activitat sindical.

Coccocarpia epiphylla (Fée) Krhbr
Circinaria epiphylla Fée Ess. p C.
 tab. II fig. 12.

Thallus foliaceus, tenuis, virescenti-caeruleescens, laciniatus, laciniis linearibus pinnatifidis vel multipartitis orbiculariter dispositis, substrato (folio) arcte adpresso, subtus fibrillis rhizineis pallidis vel nigricantibus obsitis et margine tenuiter atque breviter albido-vel nigricanter-ciliatis; apothecia cinereo-flava, immarginata, suborbicularia, demum rotundo-diformia, vel plane difformia, dispersa, thallo adnato aut maculiformiter adpresso; spores 8 nas, ovoideae vel oblongae, hyalinae, simplices (contentu non emino claro), valde minutae, long. 0,003-0,004, crass. 0,003. mm.; hypothecium hymeniumque luteola, paraphysisibus brevibus gracilibus.

Ad folia coriacea arborum sempervirentium (eoll. Nro. 217).

Species distinctissima cum nulla alia specie generis *Coccocarpiae* commutando, a lichenologis recentioribus omnino injuste neglecta atque praetervisa. Lacinae thalli approximatae aut nonnihil divergentes, semper orbiculariter dispositae et nonnunquam thallo ita adpresso, ut totus lichen fore maculam orbiculariem videatur efformare. Tomentum thalli rhizineum infernum nigricans vel albidum, plerumque densum; lacinae laciniulaeque ad extremum semper rotundatae.

Gonidia pulchre glauco-virescentia, subrotunda vel oblonga, long. 0,008—0,009 crass. 0,004—0,005 mm. Specimina denique adtingunt diam. usque ad 3 cm.

Coenogonium tenuissimum Kryph. **spec. nov.**

Thallus pallidus vel pallido-virescens, laxe tomentoso-intricatus, filamentis gracillimis, crassis 0,006—0,07 mm., virgultulas efformans parvas (altit. 2,8,—3,8, long. 2,5—13,0 mm) tenues gracilesque, horizontaliter margine extremo (vel acie) folii lanceolati arboris cu-jus-dam semper-virentis prorecte insidentes: apothecia dispersa, pallide luteola, valde minuta, sporae...

Ad folia arboris cuju-dam (ut jam dictum) semper-virentis (in collect. sine Numero).

Species filamentis prae aliis gracillimis et sede singulari notabilis, vix status juvenilis Coenogonii cujus-piam iam noti.

Filamentorum cuticula externa (epidermis) crebre nodulosa vel gibbosula,

Geological Survey of Canada No. 1

... 100,000 francs, including advances, amounting
4,8-8,2 mill. francs) excepting amounts relating
to dividends paid, including amounts due to 1-6,8 per
100 francs of stock held (plus 1%), or more than
such stock is represented by, which amounts are not
deducted, although such amounts are not
represented (including amounts due to 1-6,8 per
100 francs of stock held).

**Lecidea cinnamomea Krphbr. spec.
nov.**

Thallus cinnamomeus, maculas sat tenues, subfurfuraceas, scabriuscnlas, opacas, contiguas efformans, limite indistincto, dilavato; apothecia mediocria vel parva, numerosa, disco livido-nigricante aut livido-fusco-atro, opaco, convexulo, immarginato; thalamium albidum, hypothecium duplex, strato superiore fusco, infra transiens in stratum albidum; sporae aciculares, pluries-septatae, long. 0,025—028, crass. 0,001 mm.; paraphyses breves, non bene discretae.

Ad superficiem superiorem folii coriacei arboris cuiusdam semperfurentis, ubi ab hoc lichene latera occupantur juxta folii costam medium (coll. Nr. 226). Species valde distincta, jam singulari thalli colore facile dignoscenda. Apothecia diam. circ. 0,5—0,6 mm., juvenilia livida, margine dilutiore obsoleta, mox evanido. Sporae gracillimae.

Lecidea galbinea Krphb. spec.
nov.

Thallus glaucescens, maculam tenuem subrotundam (diam. 1—3 decim.) contiguam vel dislaceratam et irregulariter dilatatam efformans, superficie granulis minutissimis crebris intus luteis conspersa; apothecia minuta, dispersa, sessilia, disco subplano luteo-fulvescente, margine integro concolor tenui interdum evanide cincto, intus lutea. Sporae ut in Lecid. palmicola Tuckerm.

Ad folia coriacea arboris ejusdam, in consortio cum Lecid. palmicola Tuckerm. (coll. Nr. 220. a.)

Affinis Lecid. palmicola Tuckerm., pro cuius varietate primum habuimus, sed transitus nunquam vidimus itaque revera thallo pallidiore minute granuloso diversa esse videtur. Haec granula detersa interdum oculo nudo veluti maculam tenuem reppresentant laete aureum vel luteum.

? *Phlyctis arachnoidea* Krph. spec.
nov.

Thallus pallido-vel sordido-virescens, subhygroscapus,
e filamentis multipliciter intertextis, hyalinis, immixtis
gonidiis viridibus, constans maculansque plus minus con-
tinuum, byssoides-foveolatum, tenuem, primo araneosam
et tandem sublepidotam formans, indeterminatus; apo-
thecia dispersa, minutissima, disco obscurō punctiformi
concave, margine thallino albō aut virescente crass-
iusculo subholosericeo—ciliato cincto; thecae monosporae,
spora fusiformi-oblonga, muraliformis, long. circ. 0,12,
lat. circ. 0,040 mm.; paraphyses concretae.

Ad folia coriacea arboris cuiusdam semperfurentis
(coll. 221 a.)

Species memorabilis, praesertim thallo singulari tenui
foveolato-byssideo, arachnideo facile digerendis,
caeterum locus ejus systematicus nobis adhuc dubius.
Apothecia minutissima, tantum ope lenti visibilia.

四〇八

**Platygrapha minima Krph. spec.
nov.**

Thallus macula parva, pallide cinereo-fuscescente opaca irregulari tenuissima indicatus: apothecia minutissima prominula, disco atro piano vel concaviusculo (sicco fere punctiformi), protuberantiae thallinae verruciformi parum distinctae leviter immerso, dispersa; spora 8 nae, hyalina, fusiformi-oblongae aut oblongae, 4— loculares (quadrisectatae), long. circ. 0,013, crass. circ. 0,004 mm.; paraphyses gracillimae, hypothecium albidum.

Ad folia arboris cuiusdam sempervirentis (Fici?).

Collect. 201 a.

Species minuta, inconspicua, praesertim exiguitate apotheciorum a caeteris kujus generis speciebus distinguenda.

an der X. stattfindet entsprechend

? Platygrapha mirifica Krphbr. spec. nov.

Thallus pallide testaceus vel albidus, immo glaucescens, primum dendritico dilatatus, ramis ramulisque gracilibus angulosis et immixtis numerosis particulis vel foliolis singulis rotundatis appianatis concoloribus, tandem ramulis foliolisque confluentibus in crustam tenuem plus minus continuam, primo adhuc ruguloso-vel subgranulato-inaequalem, denique vero laevem, subopacam, interdum superficiem totam folii coriacei, cui lichen adnatus est, obducentem; apothecia immerso-patellaformia, mediocria (diam. circ. 1 mm.), disco plano, carneo aut nubilose carneo, subrotundo, oblengo, omnino diversiformi, margine thallodè tumente tenui, parum erecto, interdum nonnihil lacerato, cincto; thalamium hypotheciumque tenuissima et vix dignoscenda, sporae (difficillime in speciminibus nostris detegendae) 4—6, cylindraceo-oblongae, hyalinae, plures septatae, submurmuriformes, long. circ. 0,044, crass. circ. 0,010 mm.; paraphyses gracillimae, flexuosa, granulis minimis adspersae.

Ad folia arboris ejusdam sempervirentis (coll. Nro. 229 b). Species maxime singularis et memorabilis, cum nulla alia commuta, cujus evolutionem completam ex primordiis usque ad formam typicam observare specimina praesentia permiserunt.

61

WONDOOR VEDDELI CORNULUS ALGARVIAE.

Leaves oval or lanceolate, pointed, stiff, smooth, dark green above, pale beneath, with a few small white dots, and a few short hairs on the midrib; petioles long, slender, smooth, with a few short hairs; flowers yellow, in terminal cymes, the pedicels long, slender, smooth, with a few short hairs; calyx five-toothed, smooth, with a few short hairs; corolla five-toothed, smooth, with a few short hairs; stamens five, inserted in the throat of the corolla; style smooth, with a few short hairs; fruit a capsule, smooth, with a few short hairs; seeds numerous, small, smooth, dark brown.

Platygrapha chlorochrop ^{Khb.}
spec. nov.

Thallus macula parva, tenui, rotundata, ~~continua~~
vel vario modo interrupta, cineo-virescente aut albido
indicatus; apothecia minuta, disco plano vel tumente,
convexulo atro, protuberantiis parvis thallinis, rot-
undatis, parum conspicuis immerso et saepe adhuc
margin'e interiore, tenui, thallo concolore, circumcisso,
tandem evanido, cincto; sporae 8 rae, hyalinae, fusi-
formes, 7—septatae vel 6—loculares, rectae aut cur-
vulae, long. 0,020, crass. 0,03 mm.; paraphyses gra-
ciles, haud bene discretae.

Ad folia coriacea arboris ejusdam semper virantis,
socia Platygr. myrifica Kphbr. (coll. Nr. 229. a).
Species parva et inconspicua, sed habitu peculiari.

Platygrapha striguloides Nyl.

En. gen. Lich. p. 131 (nomen.) —

Thallus macula parva, tenui (diam. circit. 2—6 mm. et ultra) rotundata, virescente, eleganter minutissime granulosa (vel potius punctata) indicata, plerumque plures maculae tales hypothallo obscuro tenuissimo adnatae, approximatae vel demum confluentes; apothecia protuberantibus thalli parvis, saepe obsoletis immersa, disceo orbiculari nigricante, plano, opaco (facile elabente), thallo leviter marginato; sporae 4—6 nae, daetyloideae aut fusiformi-cylindraceae, hyalinae, 3—4 septatae, long. 0,022, crass. 0,005 mm.; hypothecium lividum, paraphyses graciles, conspicuae.

Ad folia coriacea arboris cuiusdam sempervirentis (coll. Nro. 232.a.)

Specimina Bornensis omnino quadrant in archetypum hujus speciei. a cel. auctore nobis olim communicatum.

by Mr. Scholten's suggestion.

**Verrucaria albicera Krph. spec.
nov.**

Similis Verrucariae limbolatae Krph., sed differentia
apotheciis perithecio luteolo et vertice miutissima
papillula vix visibili instructis: sporae 8 nae, hyalinae,
fusiformes, 3—septatae, lorg. 0.022, crass. 0.004
mm.: paraphyses numerosae, graciles, bene conspicuae.

Crescit mixtum cum Verruc. limbolata Krph. ad
folia lanceolata arboris vel fruticis cuiusdam semper
virentis. sed semper separaque observavimus trans-
itus. Thallus illo V. limbolatae pallidior atque uti
haec maculas parvas efformans (coll. 225 b.)

Verrucaria limbolata Krph. spec.
nov.

Thallus macula parva tertii cinereo-virente irregulariter dilatata indicatus; apothecia valde minuta, dispersa, perithecio nudo hemisphaerico (pacchioide atropurpureo, madefacto vinoso-rubente, integro, (ab o vertice ostio perforato), basi ambo lido angulo cincta; sporae 8 nae, fusiformes, hyalirae, 2—septatae long. 0,022, crass. 0,005 mm.: paraphyses nullae.

Ad folia (lanceolata) aliorum vel truncis cuiuscum semperiventris, ut videtur; (coll. 225).

Species distincta, thallo perspicue cinereo-virente: que peritheciis madidis vinoso-rubentibus facile distinguenda. Perithecia diam. circ. 0,2—0,3 mm.

**Verruearia melanobapha Krphbr
spec. nov.**

Thallus primum maeula parva irregulariter dilatata, tenuissima, obscura vel virescenti-fuscescente, opaca indicatus, quae macula, lentis ope inspecta appareat myceliiformis vel hypothallina? et quasi ex filis nigricantibus, subtilissimis, retiformiter et dendritice intertextis substratoque tenuiter insculptis composita, tandemque transire videtur in thallum continuum, tenuissimum, maculiformem, viridem; perithecia hemisphaerico-prominula, atra minora (circ. 0,7 mm. diam.), opaca, vertice pertuso, dispersa, dimidiata, nucleus nigricantem includentia; sporae 8nae, oblongo-fusiformes, hyalinae, demum fuscescentes, 1—septatae, in ascis longis anguste-cylindricis uniseriatae, long. 0,016, crass. 0,00—0,04 mm. ; paraphyses desunt.

Ad folia arboris cuiusdam sempervirentis (coll. Nro. 219).

Species nonnihil dubia, fungoides. Thallus inter perithecia punctis atris (spermogoniis?) multis censitus.

Perithecia facile elabuntur.

ad quodcumque aliquem

Verrucaria monocarpa Krph. spec. nov.

Thallus *plagula* vel *macula* tenui, minuta, determinata, rotundata, olivacea vel pallide olivacea indicatus, cuius medium occupat verruca singula valde parva atropurpurea, hemisphaerico-prominula, subnitida, vertice internum leviter papillulata.

porae. . .

Ad folia coriacea arboris cuiusdam sempervirentis
(coll. 269 b 269. e).

Lichen monocarpus, inconspicuus, oculo nudo vix
visibilis et supra folium, quod incolit plerumque singulatim dispositus. rarius specimina plura (3—6) approximata inveniuntur.

Plagula thallodea orbicularis vix 0,75 mm. lata,
verrucam solitariam in medio ejus sedentem quodammodo
limbi adinstar cingens. Apothecia juniora carposa.

Verticaria (Porina) rufula Krb.
spec. nov.

Thallus maculas et parvas (diam. circ. 5—8 mm.) subrotundas, dispersas aut inter se approximatas, colore testaceo, efformans; perithecia valde minuta, hemisphaerico-prominentia, rufa (quaeque macula 5—15 perithecia et ultra ferens); spora 6—8-nae, fusiforme oblongae, hyalinae, 4—5 septatae, long. 0,032—0,034, crass. 0,008—0,009 mm, paraphyses gracillimae, parce, discretae.

Supra folia arboris ejusdam semper virentis.

Species colore thalli testaceo et peritheciis amoenis rufis facile dignoscenda.

**Verrucaria (Porina) virescens
Krpbr. spec. nov.**

Tballus macula parva tenui pallide virescente continua vel vario modo interrupta et disjecta indicans; perithecia flavidо-pallida, minuta dispersa, hemisphaerico-prominentia, vertice papillula aut ostiolo emerso obscura vel fuscescente punctiformi instructa; sporee 6—8 nae, elongato-fusiformes, angustae, hyalinæ, constanter 7—septatae, long. 0,075—077, crass. 0,0055—006 mm.

Paraphyses non observavimus.

Ad folia lanceolata arboris cuiusdam sempervivæ.

Affinis Porinae nuculae Ach., sed differt peritheciis minoribus, loco natali etc.

Myriostigma candidum Kiph.
genus et species nova.

Thallus tenuissimus albidus continuus, substrato (folio) translucenti quasi afflatus, plegasque ejus maiores irregulariter obducens apothecia minutissima (microscopica) punctiformia, fuscescentia, numerosissima, gregatim congesta et stromatibus candidis depressis, oblongo-diformibus (lat. circ. 2,0—4,0 mm.), sed dispersis, innata; asci subglobosi (illis Arthoniam multarum similes), spora 4nae, fusiformi oblongae, constanter curvulae, hyalinae, muriformes, interdum medio nonnihil constrictae et septatae, long. 0,39—0,49, erass. 0,011—0,013 mm.; paraphyses nullae.

Ad folia arborum plurium sempervirentium (coll. 224, ubi evolutio completa hujus lichenis ab ortu usque ad statum typicum facile observare potest).

Species memorabilis, cum nulla generis alii comparanda. Apothecia microscopica et rufatibus plerisque candidissimis iratis, tartufoletis et evitilia; vetusta elabunt et foveolas microscopicas (quasi acofactas) relinquunt.

Alia species generis hujus novi est *Myriostigma cardinale* Kiph., in India orientali, Yemak Hpyau Cheung, lecta in statu optimo ab amico S. Kurzio, investigatore praestantissimo et collectore Florae Indicae, ad *Bambusam arundinaceam* Willd.

Equinoctial festival
annually at the University of All
Saints, Mexico City, on the 21st of March.
The festival consists of a series of
lectures, discourses, and other
publications, which are delivered
by the professors and students
of the university.

Tricharia melanothrix Fe^r Ess.
p. LXXXVII et CII, tab III.f. 18.

Ad superficiem superiorem folii lanceolati arboris
cujuspiam sempervirentis (coll. Nr. 231).

Species aenigma sistens lichenologicum adhuc sol-
vendum!

Specimina praesentia, ut semper, sterilia; caeterum
haec plantula sine dubio pertinet ad lichenes, quod
thallus satis demonstrat.

**Tricharia orbicularis Krphbr. spec.
nov.**

Thallus plagulam formans orbicularem vel suborbicularem, determinatam, virescentem vel albido-virescentem majusculam (diam. 2,5 — 4,5 mm.), supra substratum (folium) paullulum prominentem, planam, ambitu subintegro, leviter fusco-marginato; apothecia atra, primum verrucaeformia, nitida, minutissima, pluribus talibus verruculis supra superficiem plagulae thallinae dispersis, parum prominentibus, tandem vertice producentibus setulam atram gracillimam elongatam et attenuatam. Nec in apotheciosis junioribus verrucaeformibus nec in vetustioribus setulis jam ornatis vestigium ullum thallamii vel sporarum invenimus.

Ad folia coriacea arboris cuiuspiam semperfurentis, frequens (coll. 232 a., 269 d.). Plantula ob defectum thalamii ambigua, sed sine dubio verus lichen.

Plagulae orbiculares semper solitariae supra folii superficiem dispersae et valde conspicuae.

In speciminibus praesentibus hae plagulae thallodeae plerumque tantum initiis apotheciorum, puncta atra sistentibus, raro verrucis evolutis apparent consitae et puncta illa nigra atque verrucae saepissime setulis orbatae (verisimiliter tritu) se praebent.
